Project Topic:

Gender Equality

Title of the Project:

Epicene

Abstract

Purpose :-
Gender discrimination is a widely analyzed problem, which seems to affect different countries and cultures over time. Nowadays, we are witnesses of the social inequality reflected by the salary difference between women and men for the same employment in various professions like medicine, science, business, etc.
Letters of recommendation and evaluations written for women differ in key ways from letters written for men.
The differences impact everything from how women are graded in a class to whether they are hired or promoted

Procedure :-
Most writers (men and women) are unaware of gender bias in their writing. Reading for Gender Bias is a web-based text analyser that:

- Scans texts or paragraphs for language associated with bias.
- Summarizes changes that would reduce.
- Increases awareness of gender bias.

Conclusion :-
With the aid of this software we try to reduce the gap between genders with the aim of bringing awareness of gender equality and ensuring transparency and a bias-free environment.
